

The vector  $b = \begin{bmatrix} 4 \\ 1 \\ -17 \end{bmatrix}$  in the plane is spanned by  $a_1 = \begin{bmatrix} 4 \\ 4 \\ -2 \end{bmatrix}$  and  $a_2 = \begin{bmatrix} -2 \\ -3 \\ 7 \end{bmatrix}$ .  $\square$

18) Let  $v_1 = \begin{bmatrix} 1 \\ 0 \\ -2 \end{bmatrix}$ ,  $v_2 = \begin{bmatrix} -3 \\ 1 \\ 8 \end{bmatrix}$ , and  $y = \begin{bmatrix} h \\ -5 \\ -3 \end{bmatrix}$ . For what values of  $h$  is  $y$  in the plane generated by  $v_1$  and  $v_2$ ?

Soln: The plane generated is actually the span of the vectors  $v_1$  and  $v_2$ . By defn. of Span,  $y$  is in the plane generated if  $y$  is a linear combination of the vectors  $v_1$  and  $v_2$ . That is,  $x_1 v_1 + x_2 v_2 = y$  for some  $x_1, x_2 \in \mathbb{R}$ . This is equivalent to claiming that the augmented matrix  $[v_1 \ v_2 \ y]$  has a solution set.

$$\begin{bmatrix} 1 & -3 & h \\ 0 & 1 & -5 \\ -2 & 8 & -3 \end{bmatrix} \xrightarrow[\substack{\text{Row 2} = \text{Row 2} \\ + 2 \times \text{Row 1}}]{\text{Row 3} = \text{Row 3} - 2 \times \text{Row 2}} \begin{bmatrix} 1 & -3 & h \\ 0 & 1 & -5 \\ 0 & 2 & 2h-3 \end{bmatrix} \xrightarrow[\substack{\text{Row 3} = \text{Row 3} - 2 \times \text{Row 2}}]{\text{Row 3} = \text{Row 3} - 2 \times \text{Row 2}} \begin{bmatrix} 1 & -3 & h \\ 0 & 1 & -5 \\ 0 & 0 & 2h+7 \end{bmatrix}$$

Verification that the final matrix is in echelon form

If  $2h+7 \neq 0$ , then there are no zero rows in the matrix.  $\therefore$  The condition that all non-zero rows must be above all zero rows is vacuously true.

If  $2h+7=0$ , then the third row is a zero row. The first two rows are non-zero rows.  $\therefore$  The condition that all non-zero rows must be above all zero rows is True.

2. Row 1 leading entry = 1 in Column 1  
Row 2 leading entry = 1 in Column 2  
Row 3 possible leading entry =  $2h+7$  in Column 3

$\therefore$  The condition that the leading entry of each row must be in a column to the right of the columns of the leading entries of all rows above it is True.
